Cognition develops Devin, a cloud-based AI software engineer that helps large, complex enterprises modernize, secure, and accelerate their software development with AI. Cognition is focused exclusively on building the future of software engineering.

Devin accelerates the full software development lifecycle by completing work end-to-end in its own development environment, running as thousands of parallel agents, and integrating into existing processes.

Devin helps enterprise organizations in highly regulated environments—including Goldman Sachs, Mercedes-Benz, and the US Army—migrate legacy systems, find and remediate security flaws, and ship new features. Since the first enterprise deployment in late 2024, the company has grown to ~$1B in ARR, and usage has grown over 20x this year. Cognition recently announced its $48B Series E raise in September 2026 and has its own Federal component and FCL.
