EPOCHGEO

Mission Data. Working Software. Measurable Results.

COMPANY PROFILE

AFCEA TechNet Transatlantic 2026

EpochGeo is a U.S. small business focused on turning difficult mission data into usable operational capability. We build the data pipelines, analytic services, geospatial workflows, and mission applications that help defense and intelligence users collect, organize, correlate, analyze, and act on information across complex environments.

COMPANY OVERVIEW

EpochGeo works in environments where information is distributed across multiple sources, formats, systems, organizations, and security boundaries. Our teams combine data engineering, analytics, software development, geospatial expertise, and mission-user engagement to deliver working capabilities that reduce manual effort and improve how information reaches analysts, planners, and operators.

We are not positioned as a generic technical staffing company or as a vendor selling a single platform. EpochGeo is a technically focused mission partner that integrates with existing Government and Prime architectures, solves defined capability gaps, and builds around the customer's data, infrastructure, operational workflows, and requirements.

CORE CAPABILITIES

Mission Data Integration

Connect and organize structured, unstructured, geospatial, temporal, and externally sourced data so users can work from a coherent information environment.

Collection & Processing Automation

Automate repeatable collection, enrichment, transformation, and processing tasks to reduce manual workload and improve consistency.

Geospatial & Temporal Analysis

Identify movement, relationships, patterns, anomalies, and change across geography and time in support of specific mission questions.

Analyst-Focused Applications

Build practical user interfaces and backend services that allow analysts to search, filter, correlate, visualize, and exploit mission data.

Rapid Mission Prototyping

Move from mission need to working prototype quickly, incorporate direct user feedback, and refine the capability before large investments are made.

Applied Analytics & Modeling

Evaluate analytic methods against a defined baseline and retain the approach that improves speed, repeatability, accuracy, or mission relevance.

Large-Scale Data Management & Processing

We leverage our proprietary technologies to efficiently ingest, manage, and analyze large volumes of disparate data, enabling scalable data integration, rapid discovery, and streamlined analytical workflows.

Open-Source Intelligence (OSINT) & Commercial Data Exploitation

We combine OSINT expertise, commercial data brokerage, and proprietary backend architectures to integrate and exploit commercially available information, including AdTech data, delivering actionable intelligence and mission-relevant insights.

HOW EPOCHGEO IS DIFFERENT

Mission first. We begin with the decision the analyst or operator is trying to make, the information required, and what prevents the user from exploiting it today. Technology is selected after the mission problem is understood.

End-to-end technical ownership. Our teams can work from source data and ingestion through transformation, analytics, geospatial processing, backend services, applications, and analyst workflows reducing handoffs between specialized vendors.

Built around Government control. Our approach is designed around Government data and infrastructure. Customers retain control of their information and computing environment while EpochGeo supplies the engineering and software needed to exploit it.

Small teams with direct mission access. We place technical personnel close to mission users, shortening the feedback cycle between operational need, technical implementation, and working capability.

Measure improvement. Where a baseline exists, we evaluate processing speed, analyst workload, repeatability, data availability, time from collection to exploitation, and operational relevance. The goal is measurable improvement, not technology for its own sake.

MISSION RELEVANCE FOR EUCOM, NATO & ALLIED PARTNERS

Coalition operations create an inherently distributed information problem: data may originate from different nations, organizations, sensors, applications, standards, and security environments. EpochGeo is suited to environments where the challenge is less about acquiring another enterprise platform and more about making existing information usable across mission workflows.

• Distributed data access and exploitation	• Intelligence-data integration
• Geospatial and temporal analysis	• Commercial and publicly available information processing
• Automated collection and enrichment	• Cross-organizational analytic workflows
• Operational software development	• Rapid experimentation and prototyping

EPOCHGEO APPROACH

Operational Intelligence Support. EpochGeo transforms complex, disparate data into usable information for analysts, planners, and decision-makers. We develop repeatable workflows that integrate multiple data types, expose relationships and emerging activity, and reduce the time analysts spend locating and preparing information.

Faster Analytic Processing. EpochGeo establishes performance baselines, identifies processing bottlenecks, evaluates alternatives, and refines technical approaches to improve speed, efficiency, and scalability while maintaining the reliability required for mission use.

Prototype to Operational Use. EpochGeo emphasizes early working capability, direct user feedback, and iterative refinement. This lets customers evaluate whether a solution improves the mission workflow before committing significant resources to a larger implementation.

MEETING FOCUS

WHAT EPOCHGEO OFFERS	WHAT EPOCHGEO IS SEEKING
• Mission-data integration and engineering • Geospatial / temporal analytics • Collection and processing automation • Analyst-facing mission applications • Rapid prototyping and software development • Technical augmentation for Prime solutions	• EUCOM / NATO mission requirements • Government organizations with data-integration or analyst-workflow gaps • Prime contractors pursuing European defense and intelligence work • European / Allied partners seeking U.S. mission-data expertise • Teaming opportunities where EpochGeo can provide specialized technical content

WHY EPOCHGEO

EpochGeo maximizes the operational value of customer's existing data, systems, and infrastructure, but still has a gap between the information available and the capability the mission user needs. We deliver specialized engineering, advanced analytics, and mission-focused software capabilities that bridge the gap between existing systems and operational requirements. Our solutions seamlessly integrate with established architectures, maximizing existing technology investments while strengthening interoperability, information sharing, and operational collaboration.

COMPANY INFORMATION

EpochGeo, LLC (U.S. Small Business)

Primary Markets: U.S. DoW, Intelligence Community, and Allied / Partner mission environments
