Kyiv City Council is the local government of Ukraine's capital, serving a city of close to three million residents and responsible for the full range of municipal services: transport, utilities, housing, healthcare, education, public safety and emergency response.

I serve as CIO Advisor, where my work sits at the intersection of governance and digital transformation. In practice that means the governance of public-sector AI, municipal digital public infrastructure, and the city operating models that allow services to keep running under sustained disruption. Kyiv has had to treat resilience as a daily operating reality rather than a design property, and much of our experience is directly transferable to cities facing uncertainty of other kinds.

What I am looking for at the B2B meetings

1. Technology partners working on resilient critical infrastructure, secure digital public services and public-sector AI governance.

2. Cities and national agencies interested in exchanging practice on digital resilience and continuity of services.

3. Research institutions and consortium builders seeking a municipal partner with operational evidence, particularly for EU-funded programmes.
